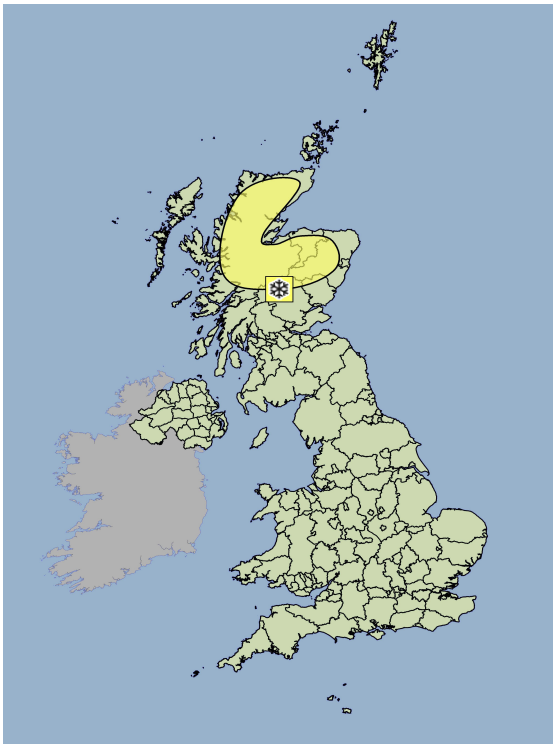
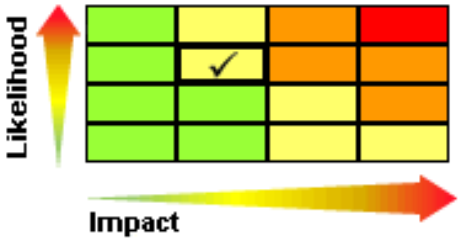
National Severe Weather Warning Service





Chief Forecasters Assessment
An occlusion will move south across Scotland during Friday, with snow initially falling to relatively low levels, but this will become restricted to higher ground through the afternoon, before colder air returns from the north by evening with showers then falling as snow to low levels once again. As the front clears the temperature will fall rapidly with ice forming on untreated surfaces (this will be covered by a more general Ice warning to be issued later on Friday morning).

The Met Office have issued a **Yellow Warning** of **Snow**

Valid from **11:00 on Fri, 12th Dec 2014** until **07:00 on Sat, 13th Dec 2014**

A spell of rain, sleet and snow will move southeast across Scotland during Friday. This is likely to fall as rain or sleet at lower levels, however falling as snow above 150 metres with accumulations of 2-5 cm on higher routes, particularly the higher roads of Moray and Grampian. This will then be followed by scattered, wintry showers moving in from the north and these could also also bring further snow accumulations, even to lower levels.

The public should be aware of continued difficult driving conditions and the possibility of localised travel disruption.
